

- what do I want to learn or understand better?

We now have access to our clients API and I feel comfortable using it. There are some quirks to still work out but I'm sure that will be resolved by just doing. I kept doing some research on MongoDB and GraphQL and was able to find a solution which worked for us. I have a decent grasp on the tools now but there is still a lot to learn. Next sprint our focus shifts a little so getting a better understanding of MongoDB and GraphQL will be postponed.

My focus now is learning how to create and use reusable UI-components in android. In order to achieve this I will read their documentation as well as using other learning resources such as youtube.

- how can I help someone else, or the entire team, to learn something new?

I showed the team how MongoDB worked and how we can use it in our application. Although this was just a fairly quick overview so apart from the three of us who worked on the database implementation this week I think the rest will need some help. I will be open for any questions they may have and try to answer them the best I can.

- what is my contribution towards the team's use of Scrum?

Just like last week I have participated in all our scrum meetings and created user stories and all things that entails. I was also PO along with Fanny this week which meant that we conducted the demo for our client and discussed how we will be moving forward.

- what is my contribution towards the team's deliveries?

I completed all my user stories and participated in all meetings as well as contributing to the team reflection. In order to prepare for and complete my user stories I had to do a lot of "over time" of researching and testing MongoDB and GraphQL. This was something I was interested in and wanted to learn so I didn't mind doing it but I recognize that this much time investment is not sustainable.
