- what do I want to learn or understand better?
We currently don't have access to our clients backend-API so I haven't been able to learn much about that. I researched the libraries for SQLite in android and feel more comfortable in using that. However, our requirements have changed and we might not need a local database.

Our client has some requests which relies on new technologies all of us in our group. This includes mongoDB and a GraphQL API as well as perhaps deploying it. Since last week I have tried building my own web API in order to better understand how they work. I will continue researching in order to be able to answer our client if this is something we will actually be able to deliver on.

- how can I help someone else, or the entire team, to learn something new?
Same as week one. To extend on that I now have, and will gain more, experience relating to the new technologies we might be working with. I will share what I have learned with my team.

- what is my contribution towards the team's use of Scrum?
I have participated in all our scrum meetings and, in my opinion, brought valuable insights. I addition I have created user stories and worked on the DoD.

- what is my contribution towards the team's deliveries?
Apart from contributing to the team reflection my tasks for this week were to set up our workspace environment. I feel I had time to do a lot more but there just wasn't very much to do this week. The requirements from our client haven't been very clear and we got some changed directives in the middle of the sprint. I did not take part in the workshops since there was already more than enough people instructing (it would probably only make it more messy). Instead I spent time researching and trying to fill gaps in my knowledge regarding the new technologies we're working with in order to be better prepared for future sprint.
